

SkillNest — Phase 2 Feature Roadmap

Next phase: what to build, why it's unique vs Fiverr/Upwork, and exactly what's required (infra + modules) — in build order. The goal: Indian local + technical marketplace with AI assistance, event-driven integration (webhooks), and optional microservices split.

North Star for Phase 2

Turn SkillNest from "a gig board" into **"a verified local + online services marketplace with AI on every step"** — seller trust via eKYC, buyer trust via escrow + AI-triage disputes, and reach via WhatsApp/SMS/Hindi-first UX which Fiverr & Upwork simply don't serve.

Milestone 0 — Foundation (enables everything)

- INFRA** **Production infra from server-configuration-roadmap #1–#8** (queue on Redis, cron, real SMTP. HTTPS, storage:link, caches).
- EVENTS** **Domain events layer** inside Laravel (`OrderPlaced` , `OrderPaid` , `OrderAccepted` , `MilestoneDelivered` , `KycUpdated`) + listeners. Keeps monolith simple today, becomes microservice/Webhook payloads tomorrow.
- WHO** Webhook delivery service (retry+signature) + incoming-signed webhooks (whitelist CSRF for payment/notification callbacks).

Milestone 1 — Live marketplace feel (India-local, non-tech friendly)

FEATURE	WHY (GAP VS FIVERR/UPWORK)	REQUIRED COMPONENTS	EFFORT
LOCAL Local / "near me"	Fiverr is remote-gig only; local home services (plumber, tuition, driving) are the biggest Indian market.	Seller location + service radius, geo-pickup; search filter by city/area (search-service), availability slots (already built in P1), on-site price package.	L
LOCAL Hindi/Hinglish UI + voice requirements	Non-technical users don't type English gig briefs; breaks both Fiverr & Upwork.	i18n on main app (React), translation of listing/requirements via ai-service, Whisper voice-to-requirement on order modal.	M
TRUST Aadhaar/DigiLocker eKYC (consent-based)	India's #1 trust lever; kills fake "seller" accounts that plague gig marketplaces.	DigiLocker callback webhook, KYC status flow (P1 KYC fields already exist), OTP consent, admin verification queue.	M
AI Requirement ? auto-quote	Local sellers can't price; buyers don't know scope. Instant fair quote wins both.	ai-service prompt (requirement + catalog context + past order prices), stores suggested price/days in requirement modal, seller approves/edit.	M
AI Smart service suggestions (upgrade P1)	Recommend relevant gigs from user profile + history, not just category browse.	Recommendation endpoint (ai-service or in-app logic), user profile cache (Redis), analytics clicks/conversions.	M

COMMS WhatsApp + SMS order alerts & chat	Local sellers live on WhatsApp; email is invisible.	WABA API integration, SMS gateway, notification-service; map sellers' consent on register.	M
---	---	--	---

Milestone 2 — Trust & money mechanics

FEATURE	WHY	REQUIRED	EFFORT
MONEY Escrow auto-release timer	Fiverr pauses funds on disputes; local needs "auto-release after N days since delivery unless dispute".	scheduler job (cron #2), order.timeline events, buyer reminders, dispute guard.	M
MONEY Advance + final split payments (physical services)	Local services (paint, appliance) need 30–50% advance; Fiverr forces full advance.	order amount split, two payment intents (PaymentGatewayManager), release final on acceptance.	L
MONEY Stripe/Razorpay/cashfree + settlement upgrade	More rails + lower fees + UPI.	new drivers behind PaymentGatewayManager; settlement job to seller wallet (P1 wallet exists).	M
TRUST Trust/risk score + badges	Show verified/completed rating to reduce scam fear.	scoring service (orders, disputes, verification, response time); badge on seller cards.	M
AI AI triage for disputes	Disputes (mid-rage) solved day-1 with evidence summary instead of human backlog.	dispute module + ai-service triage prompt (order, messages, delivery files), admin inbox.	M

Milestone 3 — Advance & differentiate (impressive, "hat ke")

FEATURE	WHY (WOW FACTOR)	REQUIRED	EFFORT
AI AI deal-copilot for buyer ("blank ? describe job ? app builds structured requirement, suggests services, timeline")	Differentiator for non-tech users; converts visits.	ai-service + order modal rework + voice STT.	L
AI Translation of seller listings on-demand	Hindi + English listings side-by-side; niche no-one serves.	ai-service translate call, cache t on listing view.	M
COMMS Order timeline as "story" (photo/voice updates per milestone)	For local jobs, buyer sees progress like a Zomato/pigeon tracker — trust + trust repeat orders.	timeline model + uploads on project milestones (P1 project files exist) + push/WhatsApp.	L
MONEY Seller leveling & streaks	Gamification retains supply; Fiverr has levels, add local-mile badges.	level rules on stats service + badge UI.	S–M
LOCAL "Agency / team" mode	Small businesses offshore jobs; hire sub-sellers (team multi-handler on one order).	team model, role on orders, split settlement (complex).	L

OPS Referral + first-job guarantee / onboarding kit	Zero-to-first-order for both sides (big dropoff area on marketplaces).	referral program, guided seller onboarding checklist (services + availability + verification).	M
--	--	--	---

Webhook / Microservice / AI architecture (how it stays simple)

- **Rule 1 — events first, microservices later.** Phase 2 *starts inside the monolith* with domain events (Milestone 0). Only split a service when one concern has independent scale/team (candidates: notification-service, ai-service, search-service, later payment-service).
- **Communication** while split: HTTP JSON for sync (search, AI), Redis queue + events for async (notifications, webhooks). Webhook relay = outbound events ? signed POSTs; ingress = signed/auth'd endpoints ? jobs.
- **AI stack concrete:**
 - FastAPI microservice (ai-service) exposing /suggest , /quote , /translate , /triage , /recommend , /moderate .
 - LLM via OpenAI/Anthropic/Gemini key (env); local Ollama+LLaMA & Whisper on optional GPU box for cost/privacy (KYC-content never sent to US clouds).
 - Laravel side: simple HTTP client + queued jobs; all AI calls ASYNC (never block order placement).
- **Webhook list to implement (define once, reuse for both monitoring + client integrations):** order.created, order.paid, order.accepted, order.delivered, order.cancelled, project.milestone, kyc.updated, payout.processed.
- **Effort guides:** S <1 wk, M 1–3 wks, L 4–8 wks per feature — a single full-stack dev can deliver the whole Phase 2 in ~3–5 months sequencing by milestone.

Suggested build order (implementation sequence)

SEQ	WORK PACKAGE	OUTPUT GATES
1	Prod infra (#1–#8) + domain events + webhook relay/ingress	Queue/cron live; webhook_deliveries table; bash creatable event test.
2	ai-service base + suggest/quote/translate	AI endpoints working on staging sellers/buyers.
3	Search-service + local/geo + "near me" filter	Glq search returns localized typed-tolerant results.
4	Notification-service (SMS + WhatsApp) + order alert webhooks	Service alerts reach Telegram/SMS/WhatsApp.
5	eKYC (DigiLocker) + trust badges + KYC admin queue	Verified sellers flagged in listings.
6	Escrow timers + advance/deposit split + settlement	Money released per rules; P1 wallet settles.
7	Hindi UI + voice requirements + copilot	Order modal builds requirement from voice/text w/ AI.

8	Dispute + AI triage, leveling, referral, team-mode	Ops/admin can manage disputes with AI summaries.
9	Monitoring + CI/CD (optional parallel)	Deploys automated; errors alerted.
